

Installation guide for PostgreSQL and pgvector(containerized version):

1. Download docker on your desktop
2. Run the docker engine by opening the application
3. Open your command prompt or powershell and paste this exact command:

```
docker run --name rag-postgres -e POSTGRES_PASSWORD=admin -p 5432:5432 -d pgvector/pgvector:pg1
```

The above command will pull the image of pgvector extension built on postgresql version 16. It will save the specific pulled image as “rag-postgress” so that I can be accessed from the docker desktop software directly.
